The fault sharpens from the routine catalog to rtDD with cross-correlation: median distance from the fitted plane NCSS routine 208 m, P0 159 m, P1 141 m, LDEO 121 m; down-dip spread (RMS) 949, 587, 557, 520 m

680 common events, each catalog relative to its own centroid. Color: days since the first event; marker area 4 pt² at *M* 1, times 2.2 per magnitude unit (no magnitude: 2 pt²). Windows: east ±1,700 m, north and along strike ±2,200 m, across strike ±1,700 m, up ±2,200 m; events outside each window are counted at its top right (among them the 5 events of a small cluster to the south-east). Up is positive.
