rtDD with cross-correlation is closer to LDEO than the NCSS start and than NCEDC DD: local median 51 / 63 m (P1, horizontal / vertical), against 292 / 506 m (NCSS) and 190 / 241 m (NCEDC DD)

680 common events (679 for NCEDC DD). Local: per event, the median over its 10 nearest LDEO neighbors of the difference between the event-to-neighbor arrows. LDEO's 95% errors: median over these events of EH1 (major axis of the horizontal ellipse) and EV. Values below 1 m are drawn at the left edge (events per panel a-d: pyrtdd P1 0/2/0/0, scrtdd S1 1/3/0/0, NCEDC DD 0/1/0/0).
