Every catalog sees the same steep plane (strike 346-357°, dip within 6° of vertical); with cross-correlation the swarm is nearly as thin as in LDEO: median distance 141 m (P1), 135 m (S1), 121 m (LDEO), against 208 m (NCSS)

Plane: least-squares fit (SVD) to the 680 common events, as analyze_sanramon.plane_fit; 'own events': all of the reference's events in the box (LDEO 677, NCEDC DD 683). Sections: across-strike axis toward N82.5°E; each plane is drawn where it crosses the section through the centroid. The distances include the 5 events of the small south-east cluster, which lie far off the plane in every catalog.
